

Within-channel model sir-stir

Amy Beeston & Guy Brown

19 May 2010

- 1 Motivation for a within-channel model of perceptual compensation for reverberation
- 2 Implementation: constructing a within-channel model
 - Recycling/extending across-channel framework
 - MPR: a band-by-band metric?
 - Context Windows
- 3 Modelling experiments
 - Parameter tuning
 - Integration with ASR studies

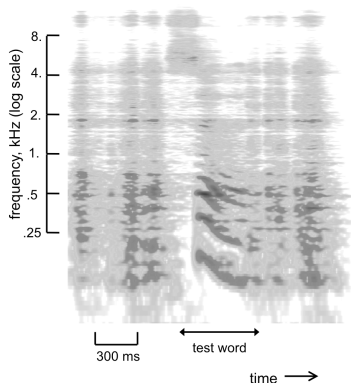

Evidence for band-by-band (i)

- Single band-context gives little or no compensation
- Compensation increases when a number of such bands are used
- Compensation effects appear to be confined to context's freq range

Ref: Watkins & Makin 2007 JASA, 2007 AAUA

Evidence for band-by-band (ii)

- Steady-spectrum noise-like contexts give substantial compensation
- esp. for single-band condition (temporal envelope of a single band is imposed in many freq channels)

Ref: Watkins & Makin 2006 ISH, 2007 AAUA

Evidence for band-by-band (iii)

- 8-band noise-vocoder speech
- each band independently present and/or reverberated
- effect of reversing half of the bands same as removing them

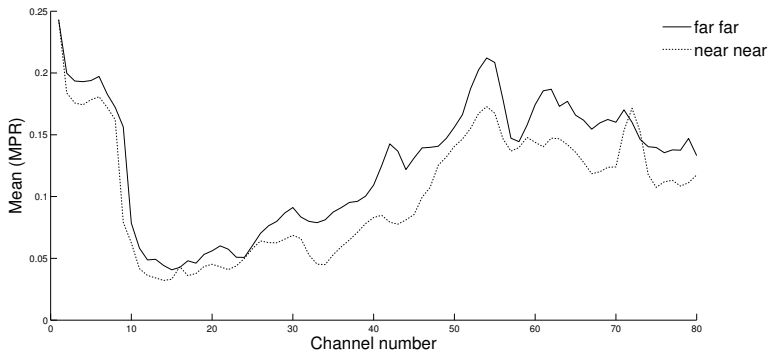

Ref: Watkins et al. 2009 BSA

Model framework

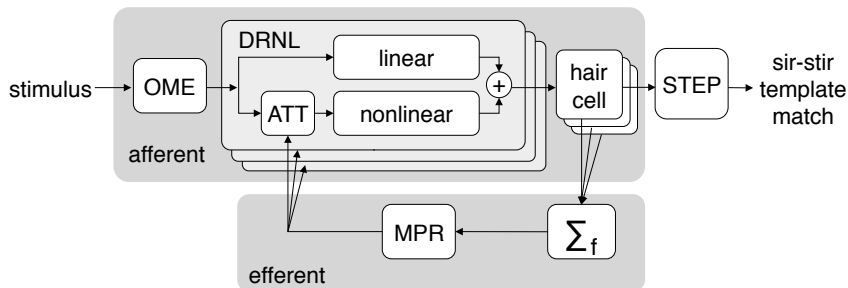

- Extension of across-channel model
- Efferent attenuation determined channel-by-channel (metric works with a single channel's context window)
- Therefore efferent processing varies with frequency

Reverberation Metric

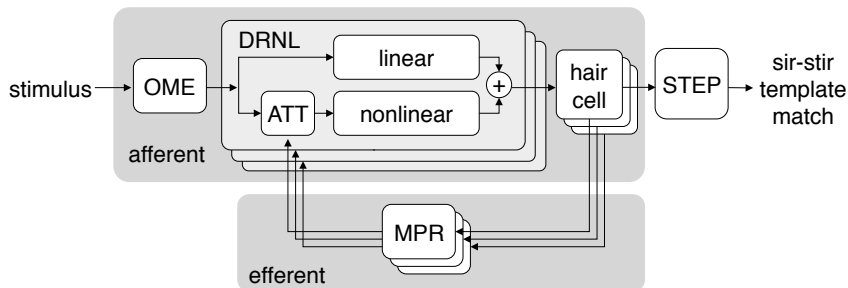

MPR: a band-by-band metric?

Across-channel model schematic

Within-channel model schematic

Frequency sensitivity of efferent system

Different contextual awareness in each channel (to determine ATT)

Ref: Guinan and Gifford (1988)

Frequency domain window shape

- flat response
simulates across channel model
- linear approximation
in region 100-8000 Hz

Context Time-windows

Again,

different contextual awareness in each channel (to determine ATT)

- Time-window length (footprint)
- Time-window shape (forgetting function)

Time windows (i) length

Across channel

Within channel

Time domain footprint

- all fixed at 1 s
simulates previous
- high freq shorter
low freq longer

Ref: Glasberg and Moore (2002)

Time windows (ii) shape

Forgetting function

- everything remembered equally simulates across channel model
- reversed exponential decay

Ref: Wixted (2004)

Tuning parameters of the within-band model

Using perceptual experiments to determine parameter settings
i.e., match listener data for sir-stir boundaries

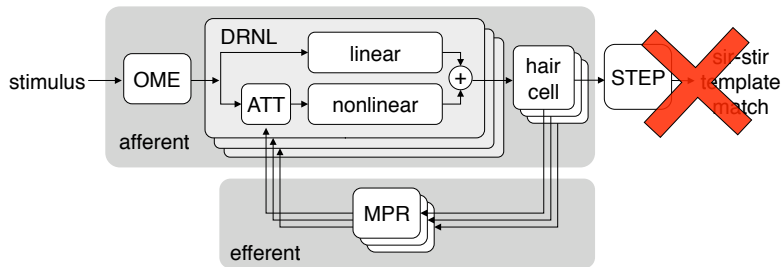

JASA 2007

- speech
- narrowband, broadband
- low, high freq

Acustica 2007

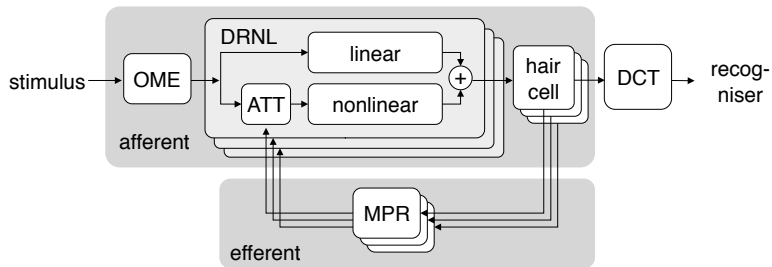

- single band
- multi-bands (3,5)
- low, middle, high freq

Integration with ASR studies

Integration with ASR studies

Model used as front end

Thanks...
