Abstract

- Considerable interest in "informed training" of DNNs: DNN input is augmented with **auxiliary codes carrying** speaker information.
- This work
- -shows mathematical equivalence between speaker informed DNN training and "bias adaptation";
- -analyses influential factors such as dimension, discrimination and stability of auxiliary codes;
- -compares different speaker informed DNN training methods in LVCSR task;
- -introduces a system based on speaker classification followed by speaker informed DNN for short utterances.

This work was supported by EPSRC Programme Grant EP/I031022/1 (Natural Speech Technology).

Background				
Signal and feature level	Integration into DNN			
VTLN (Grezl2007)	LIN (Neto1995), LON (Li2010),			
fMLLR (Yu2011)	LHN (Gemello2007), fDLR (Yu2011)			
Speaker informed DNN training	Encoding speaker information			
Eigenvectors (Dupont2000),	in DNN topology			
i-vectors (Saon2013),	Output layer (Yao2012),			
speaker codes (Hamid2013),	bottleneck layer (Doddipatla2014),			
SSBN or d-vectors (Liu2014)	LHUC (Swietojanski2014)			

Speaker informed DNN training

DNN input layer:

$$x_{2,k}(t) = f\left(\sum_{m=1}^{M} x_{1,m}(t)w_{1,m,k} + b_{1,k}\right)$$

Speaker informed DNN input layer:

$$x'_{2,k}(t) = f\left(\sum_{m=1}^{M} x_{1,m}(t)w'_{1,m,k} + \sum_{l=1}^{L} c_l(t)h'_{l,k} + b'_{1,k}\right)$$

University of Cambridge, UK. ²p.karanasou@eng.cam.ac.uk

Equivalent overall bias: $\beta_k(t) = \sum_{l=1}^{L} c_l(t) h'_{l,k} + b'_{1,k}$ - With speaker dependent auxiliary codes \rightarrow

Speaker dependent equivalent bias: $\beta_k^s = \sum_{l=1}^L c_l^s h'_{l,k} + b'_{1,k}$

- Assume optimal bias \hat{b}_{k}^{s} , ideally $\beta_{k}^{s} = \hat{b}_{k}^{s}$
- force it to be true for all speakers \rightarrow

$$\begin{pmatrix} c_1^1 & c_2^1 & \cdots & c_L^1 \\ c_1^2 & c_2^2 & \cdots & c_L^2 \\ \vdots & \vdots & \ddots & \vdots \\ c_1^S & c_2^S & \cdots & c_L^S \end{pmatrix} \begin{pmatrix} h'_{1,k} \\ h'_{2,k} \\ \vdots \\ h'_{L,k} \end{pmatrix} = \begin{pmatrix} \hat{b}_k^1 - b'_{1,k} \\ \hat{b}_k^2 - b'_{1,k} \\ \vdots \\ \hat{b}_k^S - b'_{1,k} \end{pmatrix}$$

- Special case: auxiliary code matrix is a unit matrix: **Unique Binary Index Codes (UBIC)**

Auxiliary codes

. **Dimension**

- As the number of speakers increases, the dimension of auxiliary codes should also increase.

2. Discrimination

- Linear separability and orthogonality.
- Higher discriminability \rightarrow lower condition number of auxiliary code matrix.
- Related to speaker separation using the auxiliary codes.

3. Stability

- Using only local information enables fast estimation.
- Temporal noise in auxiliary codes estimation degrades numerical stability in training, and the approximation to optimal speaker dependent biases in test.

Summary

- The dimension, discriminability and stability of auxiliary codes all influence the performance in practice.

Performance

- Seen speakers
- * i-vectors and UBIC based methods achieved equivalent and the best performance;
- * SSDNN-UBIC structure enables fast adaptation on short utterances without performance degradation.
- Unseen speakers: no improvement potentially because: * i-vectors: insufficient speaker diversity in training data; * rest methods: lacking information about unseen speakers, system overfits to training.
- by 8 dim hand-crafted binary index codes.
- -Overall: i-vectors achieved best performance, followed

UNIVERSITY OF CAMBRIDGE

• Speaker informed DNN training: common mathematical framework for auxiliary codes in DNN input.

- Equivalent to using speaker dependent biases;
